## Acknowledgements

These Data Release Notes provide information on the processing and export of data from the Transiting Exoplanet Survey Satellite (TESS). The data products included in this data release are full frame images (FFIs), target pixel files, light curve files, collateral pixel files, cotrending basis vectors (CBVs), and Data Validation (DV) reports, time series, and associated xml files.

These data products were generated by the TESS Science Processing Operations Center (SPOC, [Jenkins et al., 2016](#)) at NASA Ames Research Center from data collected by the TESS instrument, which is managed by the TESS Payload Operations Center (POC) at Massachusetts Institute of Technology (MIT). The format and content of these data products are documented in the [Science Data Products Description Document \(SDPDD\)](#)<sup>1</sup>. The SPOC science algorithms are based heavily on those of the Kepler Mission science pipeline, and are described in the Kepler Data Processing Handbook ([Jenkins, 2017](#)).<sup>2</sup> The Data Validation algorithms are documented in [Twicken et al. \(2018\)](#) and [Li et al. \(2019\)](#). The TESS Instrument Handbook ([Vanderspek et al., 2018](#)) contains more information about the TESS instrument design, detector layout, data properties, and mission operations.

The TESS Mission is funded by NASA's Science Mission Directorate.

# 1 Observations

TESS Sector 10 observations include physical orbits 27 and 28 of the spacecraft around the Earth. The use of Camera 1 in attitude control was disabled at the start of both orbits due to strong scattered light signals. Data collection was paused for 0.98 days during perigee passage while downloading data. In total, there are 25.27 days of science data collected in Sector 10.

Table 1: Sector 10 Observation times

|                          | UTC                 | TJD <sup>a</sup> | Cadence # |
|--------------------------|---------------------|------------------|-----------|
| Orbit 27 start           | 2019-03-26 22:19:33 | 1569.43176       | 246223    |
| Camera 1 guiding enabled | 2019-03-28 08:59:33 | 1570.87620       | 247263    |
| Orbit 27 end             | 2019-04-08 06:47:33 | 1581.78453       | 255117    |
| Orbit 28 start           | 2019-04-09 06:15:33 | 1582.76231       | 255821    |
| Camera 1 guiding enabled | 2019-04-11 05:19:33 | 1584.72342       | 257233    |
| Orbit 28 end             | 2019-04-22 04:17:32 | 1595.68036       | 265122    |

<sup>a</sup> TJD = TESS JD = JD - 2,457,000.0

The spacecraft was pointing at RA (J2000): 165.047459°; Dec (J2000): −54.816523°; Roll: 139.172410°. Two-minute cadence data were collected for 20,000 targets, and full frame images were collected every 30 minutes. See the TESS project [Sector 10 observation page](#)<sup>3</sup> for the coordinates of the spacecraft pointing and center field-of-view of each camera, as well as the detailed target list. Fields-of-view for each camera and the Guest Investigator two-minute target list can be found at the TESS Guest Investigator Office [observations status page](#)<sup>4</sup>.

## 1.1 Notes on Individual Targets

One very bright star ( $T_{\text{mag}} \lesssim 2$ ) with a large pixel stamp was not processed in the photometric pipeline. Target pixel files with raw data are provided, but no light curves were produced. The affected TIC ID is 438741592.

Two stars (300015238 and 306829960) were blended with very bright stars (300015239 with  $T_{\text{mag}} = 2.76$ , and 306829961 with  $T_{\text{mag}} = 4.5$ , respectively). The contaminating flux for these objects is very large, and the resulting photometry for such targets is expected to be unreliable.

Ten bright ( $T_{\text{mag}} \lesssim 5.3$ ), saturated, bleeding targets (274684383, 290794924, 303297349, 333670784, 342884451, 385220745, 386072621, 390442076, 453885273, and 460532958) had pixel stamps selected that did not fully capture the bleed trails.

## 1.2 Spacecraft Pointing and Momentum dumps

The reaction wheel speeds were reset with momentum dumps every 3.125 days. Figure 1 summarizes the pointing performance over the course of the sector based on Fine Pointing telemetry.

At the start of each orbit, the Earth was close to the boresight of Camera 1, and the level of scattered light was too high for meaningful guide star centroids to be measured. Guiding with Camera 1 was therefore disabled at these times, and attitude control was done using only inputs from Camera 4. When Camera 1 guiding was re-enabled, the spacecraft attitude shifted by a small amount, about 1 arc-second (0.05 pixels).

Figure 1: Guiding corrections based on spacecraft fine pointing telemetry. The delta-quaternions from each camera have been converted to spacecraft frame, binned to 1 minute and 1 hour, and averaged across cameras. Long-term trends (such as those caused by differential velocity aberration) have also been removed. The  $\Delta X/\Delta Y$  directions represent offsets along the the detectors' rows/columns, while the  $\Delta Z$  direction represents spacecraft roll.

## 1.3 Scattered Light

Figure 2 shows the median value of the background estimate for all targets on a given CCD as a function of time. Figure 3 shows the angle between each camera's boresight and the Earth or Moon—this figure can be used to identify periods affected by scattered light and the relative contributions of the Earth and Moon to the image backgrounds. In Sector 10, the main stray light features are caused by the Earth at the start of each orbit.

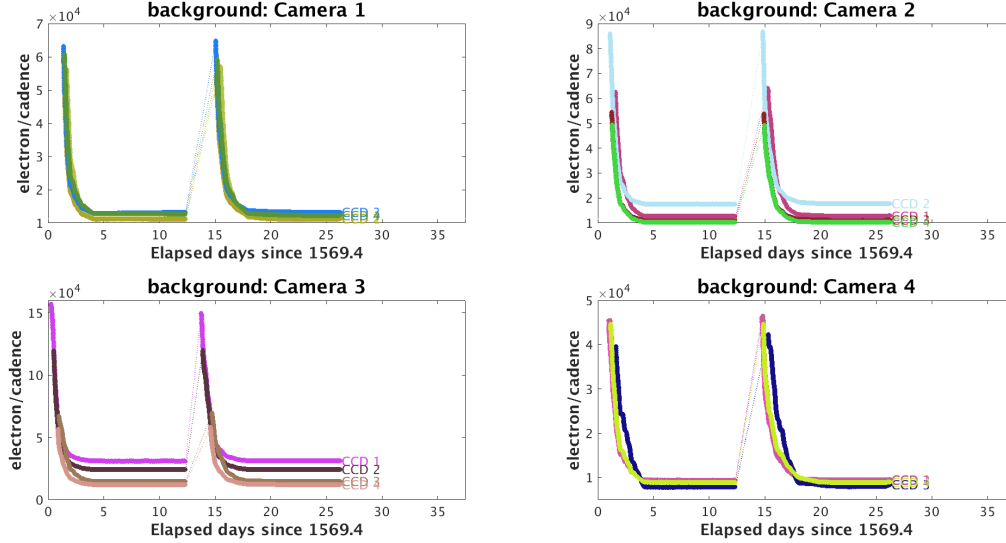

Figure 2: Median background flux across all targets on a given CCD in each camera. The changes are caused by variations in the orientation and distance of the Earth and Moon.

## 2 Data Anomaly Flags

See the SDPDD (§9) for a list of data quality flags and the associated binary values used for TESS data, and the Instrument Handbook for a more detailed description of each flag.

The following flags were not used in Sector 10: bits 2, 7, 9, and 11 (Safe Mode, Cosmic Ray in Aperture, Discontinuity, Cosmic Ray in Collateral Pixel).

Cadences marked with bits 1, 3, 4, 6, and 12 (Attitude Tweak, Coarse Point, Earth Point, Reaction Wheel Desaturation Event, and Straylight) were marked based on spacecraft telemetry.

Cadences marked with bit 5 and 10 (Argabrightening Events and Impulsive Outlier) were identified by the SPOC pipeline. Bit 5 marks a sudden change in the background measurements. In practice, bit 5 flags are caused by rapidly changing glints and unstable pointing at times near momentum dumps. Bit 10 marks an outlier identified by PDC and omitted from the cotrending procedure.

Cadences marked with bit 8 (Manual Exclude) are ignored by PDC, TPS, and DV for cotrending and transit searches. In Sector 10, these cadences were identified using spacecraft telemetry from the fine pointing system. All cadences with pointing excursions  $>21$  arcseconds ( $\sim 1$  pixel) were flagged for manual exclude. See Figure 4 for an assessment of the performance of the cotrending based on the final set of manual excludes.

In addition, strong scattered light signals affected the systematic error removal in PDC and the planet search in TPS. Cadences during this time were excluded from the pipeline analysis. The time periods for these exclusions are variable per CCD, and the corresponding cadence ranges are given in Table 2. Raw and flux-calibrated (without background correction) pixels for these cadences are provided in the target pixel files, but no photometry or centroid positions were calculated. The pipeline exports do not support data quality flags on a per CCD basis, and so the QUALITY column is not marked beyond the flags described

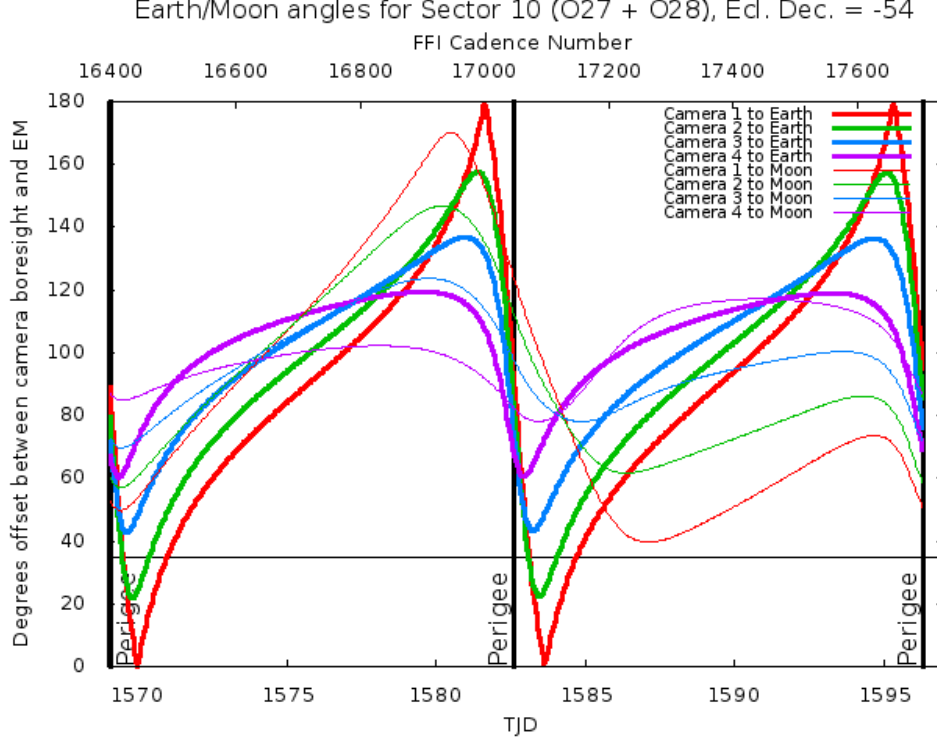

Figure 3: Angle between the four camera boresights and the Earth/Moon as a function of time. When the Earth/Moon moves within  $37^\circ$  of a camera's boresight, scattered light patterns and complicated features such as glints may appear. At larger angles, low level patchy features may appear. This figure can be used to identify periods affected by scattered light and the relative contributions of the Earth and Moon to the background. However, the background intensity and locations of scattered light features depend on additional factors, such as the Earth/Moon azimuth and distance from the spacecraft.

above.

FFIs were only marked with bits 6 and 12 (Reaction Wheel Desaturation Events and Straylight). Only one FFI is affected by each momentum dump.

## 3 Anomalous Effects

### 3.1 Smear Correction Issues

The following column was impacted by a bright star in the upper buffer row that bleeds into the upper serial register resulting in an overestimated smear correction.

- Camera 3, CCD 3, Column 2030, Star I Carinae

### 3.2 Linearity Correction

Beginning in Sector 10, a new linearity model is used in pixel calibration. The differences between new and old linearity model are quite small over the majority of the dynamic range

Table 2: Cadence ranges for data excludes due to scattered light

| Cam | CCD | Orbit 27      | Orbit 28      |
|-----|-----|---------------|---------------|
| 1   | 1   | 246223–247418 | 255821–257363 |
| 1   | 2   | 246223–247237 | 255821–257092 |
| 1   | 3   | 246223–247207 | 255821–257055 |
| 1   | 4   | 246223–247279 | 255821–257146 |
| 2   | 1   | 246223–247351 | 255821–257215 |
| 2   | 2   | 246223–247011 | 255821–256886 |
| 2   | 3   | 246223–247112 | 255821–256956 |
| 2   | 4   | 246223–247144 | 255821–256976 |
| 3   | 1   | 246223–246415 | 255821–256117 |
| 3   | 2   | 246223–246576 | 255821–256215 |
| 3   | 3   | 246223–246919 | 255821–256813 |
| 3   | 4   | 246223–246850 | 255821–256715 |
| 4   | 1   | 246223–246919 | 255821–256821 |
| 4   | 2   | 246223–247005 | 255821–256898 |
| 4   | 3   | 246223–247389 | 255821–257239 |
| 4   | 4   | 246223–247035 | 255821–256914 |

of the CCDs, rising to  $\sim 1 - 2\%$  near pixel saturation. The new linearity model will be applied to all sector data from Sector 10 on, and it will be applied to data from Sectors 1-9 when those data are reprocessed.

### 3.3 Fireflies and Fireworks

Table 3 lists all firefly and fireworks events for Sector 10. These phenomena are small, spatially extended, comet-like features in the images that may appear one or two at a time (fireflies) or in large groups (fireworks). See the Instrument Handbook for a complete description.

Table 3: Sector Fireflies and Fireworks

| FFI Start     | FFI End       | Cameras | Description |
|---------------|---------------|---------|-------------|
| 2019088042934 | 2019088045934 | 1,2     | Firefly     |
| 2019089162933 | 2019089165933 | 1,2     | Firefly     |
| 2019095065933 | 2019095072933 | 1       | Firefly     |
| 2019109155934 | 2019109162933 | 2       | Fireflies   |

Figure 4: Median absolute deviation (MAD) for the 2-minute cadence data from Sector 10, showing the performance of the cotrending after identifying Manual Exclude data quality flags. The MAD is calculated in each cadence across stars with flux variations less than 1% for both the PA (red) and PDC (blue) light curves, where each light curve is normalized by its median flux value. The scatter in the PA light curves is much higher than that for the PDC light curves, and the outliers in the PA light curves are largely absent from the PDC light curves due to the use of the anomaly flags. Note that the first and last cadences in each orbit are treated as gaps by PDC.

## 4 Pipeline Performance and Results

### 4.1 Light Curves and Photometric Precision

Figure 5 gives the PDC goodness metrics for residual correlation and introduced noise on a scale between 0 (bad) and 1 (good). The performance of PDC is very good and generally uniform over most of the field of view. There are some residual issues in Camera 3 CCD 1/2, due to the extremely crowded field in the plane of the Galaxy. Figure 6 shows the achieved Combined Differential Photometric Precision (CDPP) at 1-hour timescales for all targets.

### 4.2 Transit Search and Data Validation

In Sector 10, the light curves of 19999 targets were subjected to the transit search in TPS. Of these, Threshold Crossing Events (TCEs) at the  $7.1\sigma$  level were generated for 1026 targets. After some experimentation, we found that discontinuities in the light curves caused by the shift in spacecraft pointing when Camera 1 was re-enabled for guiding triggered many false positive TCEs. We therefore removed these times from analysis by TPS with planet search

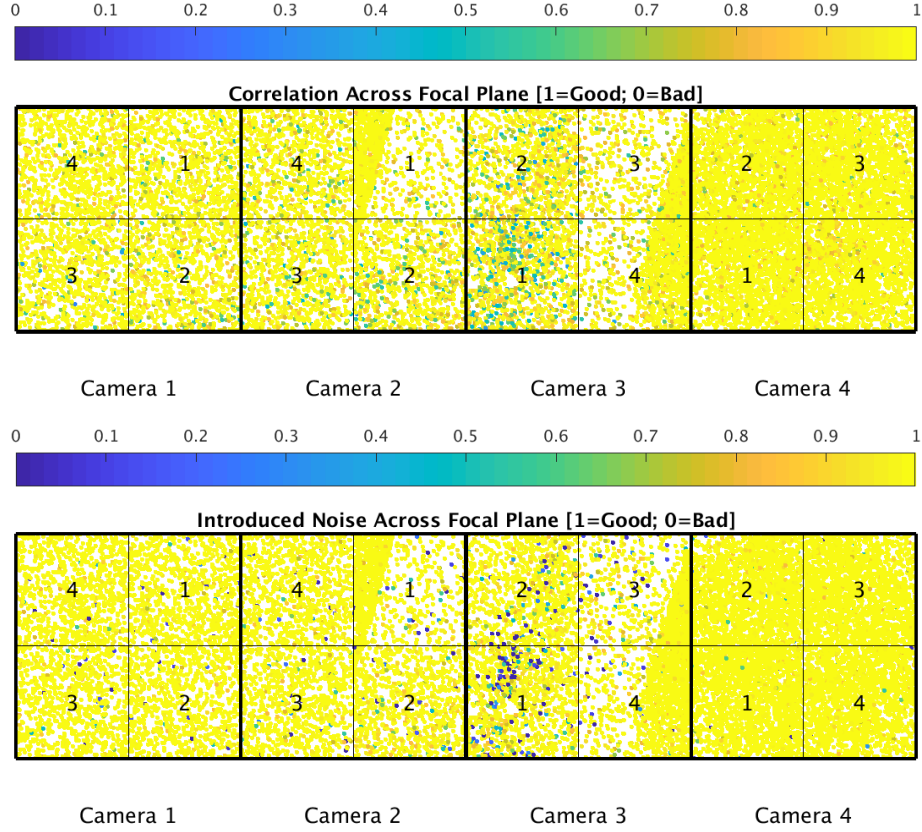

Figure 5: PDC residual correlation goodness metric (top panel) and PDC introduced noise goodness metric (bottom panel). The metric values are shown on a focal plane map indicating the camera and CCD location of each target. The correlation goodness metric is calibrated such that a value greater than 0.8 means there is less than 10% mean absolute correlation between the target under study and all other targets on the CCD. The introduced noise metric is calibrated such that a value greater than 0.8 means the power in broad-band introduced noise is below the level of uncertainties in the flux values.

exclude flags on cadences 246223–247263 in orbit 27 and 255821–257233 in orbit 28.

The top panel of Figure 7 shows the distribution of orbital periods for the TPS TCEs found in Sector 10. There is a slight excess of TCEs at orbital periods of 10 days and 14 days. Figure 8 shows the number of TCEs at a given cadence that exhibit a transit signal—the spacing between peaks accounts for the preferred periods in Figure 7, and are associated with periods of increased pointing jitter.

The vertical histogram in the right panel of Figure 7 shows the distribution of transit depths derived from limb-darkened transiting planet model fits for TCEs. The model transit depths range down to the order of 100 ppm, but the bulk of the transit depths are considerably larger.

A search for additional TCEs in potential multiple planet systems was conducted in DV through calls to TPS. A total of 1415 TCEs were ultimately identified in the SPOC pipeline on 1026 unique target stars. Table 4 provides a breakdown of the number of TCEs by target. Note that targets with large numbers of TCEs are likely to include false positives.

Figure 6: 1-hour CDPP. The red points are the RMS CDPP measurements for the 19999 light curves from Sector 10 plotted as a function of TESS magnitude. The blue x's are the uncertainties, scaled to 1-hour timescale. The purple curve is a moving 10th percentile of the RMS CDPP measurements, and the gold curve is a moving median of the 1-hr uncertainties.

Table 4: Sector 10 TCE Numbers

| Number of TCEs | Number of Targets | Total TCEs |
|----------------|-------------------|------------|
| 1              | 723               | 723        |
| 2              | 237               | 474        |
| 3              | 50                | 150        |
| 4              | 13                | 52         |
| 5              | 2                 | 10         |
| 6              | 1                 | 6          |
| —              | 1026              | 1415       |

Figure 7: Lower Left Panel: Transit depth as a function of orbital period for the 1415 TCEs identified for the Sector 10 search. For enhanced visibility of long period detections, TCEs with orbital period  $< 0.5$  days are not shown. Reported depth comes from the DV limb darkened transit fit depth when available, and when not available, the DV trapezoid model fit depth. Top Panel: Orbital period distribution of the TCEs shown in the lower left panel. Right Panel: Transit depth distribution for the TCEs shown in the lower left panel.

Figure 8: Number of TCEs at a given cadence exhibiting a transit signal. Isolated peaks are caused by a single event and result in spurious TCEs. The peaks typically align with pointing instabilities and strong background variations.
